Honours

The Honours Degree will benefit your career because:

- The Honours level is the international standard for a first degree. For international mobility, and entrance into postgraduate courses at foreign universities, the honours degree is a minimum requirement.
- The Rhodes degree is an advanced, marketable qualification, recognised internationally. The programme provides improved employment prospects (not only now, but later on in your career), and opens up increased opportunities for entrepreneurial prospects.
- It is the degree that provides entry into research and development.
- It allows specialisation not possible in general undergraduate degrees, and satisfies love of the subject.

COURSE CO-ORDINATOR

Your course co-ordinator is **Dr Mos Tsietsi**, room 028, Hamilton Building (M.Tsietsi@ru.ac.za).

Queries and comments about the Honours course should be addressed to the course co-ordinator.

ADMISSION CRITERIA

While admission to the Honours programme requires a minimum mark of 60% for CS3 (aggregate for CSc301 and CSc302), students intending to study Honours should aim considerably higher than this minimum, and obtaining the required minimum does not automatically imply acceptance into Honours.

Acceptance into any postgraduate course is at the discretion of the Department. A number of factors may be considered when we make this decision. Space or supervision constraints may limit the number of students we can accept. We will also consider performance and participation across the whole of your academic career. We may also seek evidence of passion and participation in the discipline outside the confines of our courses - a "portfolio". This could include software or games that you've written, courses you may have offered to others (e.g. a student society), web sites you might have built, learning a different computer language or operating system, using your Computer Science in your other subjects, software consulting, maintaining networks at a local school or business, and any software-related work during vacations.

COURSE OPTIONS

In the BSc (Honours) programme, you are required to take course options which count towards the final mark and which are examined formally in June or November. No more than 3 courses may be taken in the 2nd semester. The remaining marks come from project and assignment work undertaken during the year. Students may elect to do no more than one extra course.

For students registered for 100%:

60%	Six formal course examinations and practical work
40%	Project assessment mark made up as follows:
10%	Project related assignments through the year (including the final oral presentation)
30%	Final project report

For students registered for 60%:

20%	Two formal course examinations and practical work
40%	Project assessment mark made up as follows:
10%	Project related assignments through the year (including the final oral presentation)
30%	Final project report

For students registered for 40%:

40%	Four formal course examinations and practical work
-----	--

Criteria for the marking of the project will be given in a formal Project Management course, a **compulsory** module at the start of the year, that counts towards project related assignments. This module covers various aspects involved in tackling a large project, including writing and research skills. An important component of modern science is the ability to write up one's work in a clear form, perhaps with the intention of publishing it.

Each option will have related portfolio work that will consist of at least one formal submission per course. Shaded areas in the provisional course time-table denote periods that are intended for use to mop up assignment work and to focus your energies on your project work. Some of these weeks go into the vacations. It is assumed that Honours

students will be working on project coursework through the vacations.

Full time Computer Science students are required to complete six coursework modules. One of these may be an external module, with the permission of the heads of both departments concerned, with the remainder coming from the Department or Ancillary pools. Joint Honours students must complete all their modules from the Department or Ancillary pools.

This year, the following course options will be offered. They are classified into three categories.

DEPARTMENT MODULES	ANCILLARY MODULES	EXTERNAL MODULES
Architecture Computer Security Distributed & Parallel Programming Engineering in ICTD GPU programming Image Processing Real-Time Multimedia	Hardware Interfacing	Information Systems Electronics Mathematics Physics

Students must discuss their course configuration with their project supervisor. The project supervisor will determine whether their course configuration supports their project both in terms of time management and course content. Students must email their course configuration to the Honours Co-ordinator, and to the project supervisor, indicating that confirmation has been obtained.

EVALUATION

Please note that individual modules may have specific DP requirements that must be met before a student may write the examination for that module. Students should check with the lecturer of each module what the requirements are for that module.

- Normally, students must pass ALL qualifying coursework modules, as well as the project.
- Students should note that the marks for modules may be subject to scaling at the Department’s and/or the external examiner’s discretion.
- In the case of students who are not performing adequately during the year, they will be advised to withdraw from the Honours programme or to take the Honours programme over two years.

LECTURES AND TIME ALLOCATION

Lectures are either single or double period slots, which dovetail with the times of the undergraduate time-table. Other Departments use different lecturing schemes, and time tabling joint honours is sometimes rather awkward. Students planning to take modules from other Departments should be careful that their load does not become excessive at any one stage of the year.

Honours lectures will be held in the CORAL SEMINAR ROOM, HAMILTON BUILDING. You will be informed of lecture time slots by each individual lecturer.

Additional short courses of either an optional or a compulsory nature may be mounted during the year, depending on the availability of expert lecturers.

NOTE:

- (a) You will also need to timetable in
 - any part time work which you may be doing
 - Departmental seminars, at which **all** postgraduate students should be present.
 - formal project supervision sessions each week, or as arranged with your supervisor.
- (b) Note that there is an extended period of time in terms 3 & 4 with no modules on offer. This has been intentionally done to make sure significant headway is achieved towards finalising the project, and is not meant as a vacation. Furthermore, a first full draft of the thesis will be expected at the end of this time period. In addition, enrichment lectures will be scheduled during this time to provide assistance with approaching your project and perfecting the write up. These lectures and any associated assignments are **compulsory**.
- (c) Attendance at lectures, practicals, seminars and project supervision sessions is compulsory.

(d) To give you an idea of how we pitch the course work, we expect honours students to put in 50 hours of work per week. When you are attending two course options, the approximate breakdown should be:

- 10 hours on lectures
- 2 x 10 hours on practicals
- 20 hours on your project

When you only attend one course option, and during break periods, you are expected to put more time into your project work.

HONOURS PROJECTS

A very important part of the Honours year is the project, which is undertaken on a rather grander scale than anything you might have done in your undergraduate years. At one stage we adopted a policy whereby students could identify their own project, if that seemed possible, but this led to some problems in supervision and motivation, and we now favour a scheme where we provide a fairly small list of projects that are of immediate relevance to staff and research interests here.

Ideally, we would like each student to be part of a team working in an area related to one of the main research thrusts in the Department, primarily the Convergence group, the Parallel and Distributed group, the Security group or the Distributed Audio group (see Research section). You are advised to chat to staff members involved with a particular project you might be interested in before making a final choice. Project choices should be finalised by the second week of lectures. While there are different research groups and specialisations, Honours is your introduction to research. As such, the specific project you choose or area of research you go into at this early stage is not crucial, neither does it disqualify you from changing direction later and pursuing an area that diverges from your project. The purpose is to guide you and equip you with an academic approach to research, and this is independent of the project you choose.

An important part – perhaps the most important part – of the effort in the project goes into producing the report. Each report should be produced in the style of a paper for publication. We also require you to produce a short paper of your project work. One of the supervision requirements of all postgraduate projects is that the student set up and maintain a web page for their project, under the main research site of the Department and this must be updated regularly. Requirements for the project web page appear later in this handbook.

The final project reports have to include machine readable versions of the report as well as of any software written.

HANDOUT FEE

A non-refundable charge of R250-00 will be made to cover the cost of course handouts, laboratory consumables, and payments of royalties on copyright material. We keep this charge as low as possible. This amount will be debited to your student account.

AND FINALLY ...

Honours can be very worthwhile – but, like much else in life, it depends largely on what you put into it. We often have Honours students remarking that they have learned more about Computer Science in their Honours year than in their whole undergraduate degree. We hope, and expect, that you will put a lot into it, starting from day one. At this level everyone in the course – staff and students alike – become contributors to a pool of knowledge. Your project work, and the seminar programme, for example, become important areas in which information can be spread about the group as a whole.

A prize, generously sponsored by
Open Box Software,
is offered for the top student in the course

and a prize, generously sponsored by
Jannine Franke,
is offered for the top Honours research project.

SUMMARY OF HONOURS COURSES

All students who have not completed their undergraduate degree through Rhodes University are advised to discuss their module choices, in terms of what knowledge is assumed, with the relevant module lecturers at the beginning of the year.

Research (Project) Management Course (Prof Philip Machanick)

Objectives:

This course aims to equip you with the skills to complete a fairly substantial research project.

Contents:

The entire life cycle of the project is covered in detail -- from inception (finding a project topic and writing the proposal) to completion (thesis structure and assessment). Other topics cover the purpose of and how to write a literature survey, how to present a research seminar and general issues like research ethics, time management, scientific writing skills, and the use of LaTeX and BibTeX.

This module is compulsory, is assessed throughout the year and examined in the final project report.

Architecture (Prof Philip Machanick)

This course covers fundamentals of instruction set design, memory architecture and how the various components interact in achieving performance goals – whether speed, cost or energy. Practical components focus on how the RISC-V architecture has aimed to improve on previous designs. We will use simulations to study performance impacts of design decisions.

The aim of the course is to leave you with an appreciation of how to make a suitable choice among existing designs as well of research in computer architecture.

Contents:

- Instruction set architectures and design principles
- Layers of architecture
- Modes of parallelism
- Memory hierarchy

Prerequisites: introductory computer architecture, C or C++ programming in a Unix environment.

Computer Security (Prof Barry Irwin)

Objectives:

To enable students to gain a better understanding of the importance of Security within the larger realm of Information Technology and to provide insight into the effects of security on Information Systems. Emphasis will be placed on the importance of holistic integration of security practices into Information Technology. The course curriculum is structured around the internationally recognised Certified Information Systems Security Professional (CISSP) certification.

Contents:

The following components relating to Information Security are explored:

- Cryptography
- Security Architectures and Models
- Application Development and Secure programming
- Systems Security
- Operations Security
- Security Management
- Distributed Systems
- Physical Security
- Disaster Recover and Business Continuity Planning
- Network and Telecommunications Security
- Forensics and Investigation

Prerequisites:

Students should be familiar with programming constructs such as those covered in CSc201/CSc202 and a good understanding of Computer Networks and Operating Systems as covered in CSc302.

Distributed & Parallel Programming (Prof George Wells)

Objectives:

To present students with an overview of distributed computing, parallel programming, and the relationship between them. Practical sessions cover the full range of parallel and distributed processing, and use the Java programming language, which is very similar to C#.

Contents:

- Background, Terminology and Theoretical Foundations
 - Hardware issues and system architectures
 - Parallel algorithm patterns
- Parallel Processing
 - Communication and synchronization
 - Threads, Interprocess communication, CSP, GPU parallelism, etc.
- Distributed Processing
 - Remote Procedure/Method Calls, Virtual Shared Memory, Message Oriented Middleware, Grid Computing, etc.
- Formal specification
 - The CSP meta-language, specifying parallel systems, proving safety, etc.

Prerequisites: Object-oriented programming in Java (or a similar language, such as C#).

Engineering in ICTD (Prof Alfredo Terzoli)

Objectives:

This module focuses on honing general ICT engineering skills through the exposure to problems that need to be solved within difficult (and often badly specified) constraints, foregrounding good technique and innovation. While low resource settings are various in nature, the scenarios will be mostly drawn from the realities of underdevelopment and poverty.

The practical work will require the solution of a (small) real-life problem in a limited resource setting.

Contents:

- Low resource setting: characterization and identification of a problem set
- General computer and software engineering: a brief review
- Living Lab meets Agile Programming: displacing the user requirement elicitation problem and cutting useless application features
- Engineering the e-infrastructure: network and device design and deployment – fit for purpose and efficient
- Method and innovation: a concluding reflection

Prerequisites:

- A working knowledge of TCP/IP networks, Operating Systems and Java programming

GPU Programming (Prof Karen Bradshaw)

Although graphics processing units (GPUs) are well known for their use in rendering images, their power for general parallel computing has only been explored in the past few years. With the increased availability of parallel frameworks, programming models, and development tools, however, GPUs have developed into flexible processors that typically outperform CPUs in the parallel computation of many problems.

This course covers the fundamentals of parallel computing using the CUDA parallel computing platform and programming model. Basic CUDA commands and syntax, and the use of CUDA libraries are covered in depth, as well as some relevant optimizations specific to the architecture of the GPUs being used. Practical labs focussing on applications in graphics, simulations, physics, and other topics complement the programming concepts and techniques introduced in the lectures.

Contents:

- GPU Programming Model
- GPU Hardware and Parallel Communication
- Fundamental Parallel Algorithms
- Optimizing GPU Programs
- Future of GPU Computing

Prerequisites: Reasonable competence in C/C++ programming and a desire to make programs execute faster.

Image Processing (Mr James Connan/ Mr Dane Brown)

Objectives:

To introduce students to image processing. This module covers aspects of image generation and manipulation, but focusses on the extraction of information from images. The concepts covered are relevant to computer vision and image manipulation.

Contents:

Topics covered include:

- Basic concepts such as image file formats, scaling and rotation.
- Colour manipulation such as grey scaling and colour models.
- Image segmentation using background subtraction, edge detection, filters, etc.
- Image processing techniques such as Hierarchical Chamfer Distance Transforms, AdaBoost, Histograms and CAMShift.
- Taking a look at current developments in the field and directions for possible research.

Prerequisites: Enthusiasm and the ability to think outside of the box. Any language that has a wrapper for OpenCV should be usable.

Real-Time Multimedia (Dr Mosiuoa Tsietsi)

This course seeks to leverage student's background in computer networking as covered in undergraduate courses in order to introduce them to the practicalities involved in the delivery of Internet content in general, and real-time voice and video multimedia in particular. It weaves theory and practice together to equip students with the practical skills necessary to prototype networked applications, with an emphasis on voice and video over IP (VoIP). Importantly, the course touches on a new networking paradigm known as software defined networking (SDN) which is currently behind the intelligent control of multimedia applications on the Internet.

Objectives:

To bridge the gap between networking theory and practice using standard open source tools and platforms.

Contents:

- Multimedia Streaming
- IP Telephony Protocols
- Constraints in Real-time Multimedia
- VoIP Network Design, Prototyping and Benchmarking
- Software Defined Networking for Real-time Applications

Prerequisites: Basic understanding of computer networks; familiarity with the Linux environment.

Computer Hardware Interfacing (Mr Anthony Sullivan)

This is an electronics orientated course, and is presented in the Department of Physics and Electronics.

Objectives:

To provide the student with a hands on knowledge of hardware interfacing using a microcontroller environment.

Contents:

Assembly level programming of the Atmel 8-bit RISC architecture and associated common peripheral interfaces. A strong emphasis is placed on the differences to 'normal' computer programming such as no scheduling or other OS provided crutches. Practical exposure to system design of fundamental hardware interfaces.

Prerequisites: Physics 1E2 or equivalent electronics experience.

PLEASE NOTE THERE IS A 10 PERSON LIMIT ON THIS MODULE.

The course is taught via the investigation of peripherals available on the development board, how they can be made to interact and produce a desired outcome. Short tasks will be set for investigation after each lecture (not all of these are for assessment purposes). The main assessment (besides the theory examination) is a practical assignment that effectively combines elements from each of the tasks to work together to produce a stated goal.

MSc by Coursework and Thesis Specialising in Information Security

The Department of Computer Science at Rhodes University offers a part time Masters Degree Programme focused on Information Security, designed specifically for Information Security practitioners in industry. The two-year course, which has been running since 2011, takes the form of a combination of coursework modules in the first year, followed by an individual research project in the second year.

The taught component of the course is delivered by staff at the University, as well as leading Information Security practitioners from the South African Information Security Industry. The course is also available for full time students as a one-year in-attendance Masters Degree, in which the coursework and research are undertaken concurrently while resident on the Rhodes University campus.

INFORMATION SECURITY CO-ORDINATORS

The Information Security co-ordinator is **Prof Barry Irwin**, Room 006, Hamilton Building (B.Irwin@ru.ac.za). The Research methods course is run by **Prof Karen Bradshaw** (K.Bradshaw@ru.ac.za).

COURSE STRUCTURE

The part-time course is organised over two years with coursework modules completed in the first year, and an individual research dissertation completed and examined in the second year. Graduation is in April the year after completion.

Year 1

The coursework modules are delivered in Grahamstown on the Rhodes University campus over an extended weekend session (generally Friday to Sunday).

The coursework consists of two compulsory modules and three elective modules. The first compulsory module covers research methods and academic writing, and culminates in the submission of an approved research proposal by year-end. The second module is a general introduction to Information Security. Both of these modules are presented at the start of the first year typically over a single 5-day session.

A selection of elective modules are offered each year. This selection changes from year to year depending on the availability of industry partners, however, typical topics covered include the following:

- Data Analytics for Security
- Application Security (including web applications)
- Security Metrics
- Security within the Enterprise
- Threat Modelling
- Digital Forensics & Incident response
- Malware Analysis

Each module (except the Research Methods and Academic Writing module) will be assessed by a written assignment based on the module material, to be submitted a few weeks after the module is presented. Students must have attended the module to be eligible to submit the assignment. Students may be required to do pre-reading for modules. Some modules may also require students to complete exercises or give presentations that contribute to the assessment mark, while in attendance.

During the second half of the first year, individual research topics focused on some aspect within the larger Information Security space, need to be decided. Students are encouraged to engage with the lecturing staff from early in the year, to help select a suitable project research area. Once a topic has been found, a draft proposal is submitted, and the student is required to present a short talk outlining this proposal. These initial research presentations, which are typically held during one of the last two module sessions, are important in terms of providing the student with constructive feedback on the proposal, and helping with supervisor selection. Supervisor allocations are done after the final module session, after which the student is required to develop (in conjunction with the allocated supervisor) and submit a final research proposal (normally by the middle of November of the first year).

Year 2

The second year is dedicated to the individual research project that students must write-up in a formal document (spanning approximately 80-100 pages). The research is conducted in accordance with the research proposal submitted in the first year.

Although deadlines during the second year are mainly done on an individual basis by the supervisors, there is normally a compulsory workshop for all students scheduled in the middle of the year at which students are required to present on the progress of their research. Students are strongly encouraged to plan at least one other visit to campus during the year after consultation with their research supervisor.

ASSESSMENT

The assessment of the coursework component of the degree is made up of the four Information Security modules, and the Research Methods module. Each Information Security module holds an 11% weighting and the Research Methods module 6%, for a total of 50%. Assessment of the degree as a whole is based on a 50/50 weighting between the coursework and the research thesis.

Assignments typically comprise 35-45 hours of reading and writing. This may vary depending on a student's familiarity with a specific topic.

In order to proceed with registration for the research component (year 2) of the coursework MSc, the formal criteria must be met:

- The required coursework modules must have been completed successfully.
- An average mark of over 60% should have been attained for the coursework (including Research Methods).
- Thesis research proposal should have been submitted and accepted.

Students will be warned if they are in danger of not meeting the standard required. Should modules not be completed in a year, or performance be unsatisfactory, the student will be advised to withdraw, and may be prevented from re-registering.

Further details are contained in the 2018 Infosec Course Handbook.

INTERESTED IN JOINING THE COURSE?

The following sections pertain to future intakes: interested parties should email csinfosec@ru.ac.za and request to be added to the notification list. Addresses on this list will be notified when the next intake opens. Normally applications open in early August, and close mid-September in the year prior to entry.

ELIGIBILITY

This qualification is targeted at individuals who are Information Security practitioners and are looking to broaden their knowledge of the field of Information Security. Normal eligibility requirements are a Bachelors or Honours degree and five years of working experience, preferably within the Information Security field. Applicants who have suitable work experience in related fields (such as Network Operations, Auditing and Software Development) who are interested in expanding into the Information Security field are also encouraged to apply.

APPLICATION PROCESS

Candidates interested in applying need to refer to <http://www.ru.ac.za/computerscience/studying/postgraduate/mastersbycourseworkthesis/> which will give details of the application process. Further information can be obtained from Prof Barry Irwin (csinfosec@ru.ac.za)

SELECTION

Selection of candidates into the course will be decided by a group within the department, based on a number of criteria including skills, experience and the motivation provided by applicants in the Departmental Application Form. The department is looking to accept a cross-section of Information Security practitioners in order to create a diverse group. Limited positions are available for the programme.

Masters & Doctorates

The Department of Computer Science has an established and highly respected research school. Research is funded by the Telkom Centre of Excellence in Distributed Multimedia, the National Research Foundation and Rhodes University. Each year, staff members and senior students present their work in national and international forums. Several staff members serve on international advisory boards, standardisation forums, and organising committees.

POSTGRADUATE SCHOOL LEADER

The postgraduate co-ordinator is **Prof Philip Machanick**, Room 101, Hamiton Building (P.Machanick@ru.ac.za).

Queries and comments about the degrees should be addressed, initially, to him.

MASTER OF SCIENCE DEGREES - MSC

The Department of Computer Science offers a pure research MSc degree, for which the entire assessment is by thesis, and an MSc (Applied Computer Science) degree, by course work and short thesis. Since 2011, an MSc specializing in Information Security has been activated, offering an excellent possibility of further training to practitioners in the industry. Details about this offering can be found elsewhere in this handbook.

Students work on an approved research topic, under the supervision of an experienced researcher, usually contributing towards an established project. Some of the projects offered for this purpose are undertaken in conjunction with external corporations or institutions. These projects are intended to increase the relevance to industry of the degree and usually require additional visits to the institution concerned. The research is written up as a thesis, which is examined by selected area specialists external to the University.

Duration

The residence period for the Master's degree is a minimum of one full year, from February to January of the following year. An MSc thesis typically takes between 18 to 24 months to complete.

Entrance requirements

The normal entrance requirement for an MSc candidate is an appropriate Honours degree, or an equivalent qualification. In exceptional cases a BSc degree and a minimum of three years of relevant experience may be considered for acceptance.

MASTERS DEGREE PROGRESS MILESTONES

These progress milestones are intended to indicate the maximum time that a full-time student should take on each phase of the masters degree (by thesis) in order to successfully complete in a time period not exceeding two years. This allows ample time for examining, corrections, and the submission of a final paper on the work.

Students must produce reports at the end of each quarter of study detailing their progress and the meeting of the milestone requirements. More regular interim progress notes are also encouraged. Requirements for the project web page appear later in this handbook.

Year one - quarter one

At the end of this quarter, students should have:

- written a project proposal (approximately ten pages long)
- presented a seminar on the material to his or her supervisors and peers
- created a web page for the project, containing at least an abstract and description of the project, links to related sites, and a research plan for the remainder of the project.

Year one - quarter two

At the end of this quarter, students should have:

- made some progress in implementing the project
- written an extended abstract for a suitable conference's "work in progress" track, outlining the project proposal.

Year one - quarter three

At the end of this quarter, students should have:

- completed a good portion of the implementation of the project and the research should be well underway
- made contact with researchers at other institutions active in the field and received wider feedback on the content and approach of the research project
- presented a written and oral paper on the project to a wider audience than his/her immediate institution.

Year one - quarter four

At the end of this quarter, students should have:

- completed the broad implementation goals of the project
- prepared a demonstration of the work
- submitted a revised plan of action with an implementation schedule for the 2nd year of the project and an updated literature survey
- added considerably to the number of web links to related sites
- prepared a content outline for the written thesis.

Year two - quarter one

At the end of this quarter, students should have:

- made significant progress in writing the thesis
- submitted a rough draft of the thesis to the supervisor for comment
- identified all remaining problem areas that fall within the scope of the study.

Year two - quarter two

At the end of this quarter, students should have:

- submitted a complete draft of the thesis to the supervisor for comment
- made a critical self assessment on the approach of the project and the conclusions drawn
- submitted a paper to a suitable conference outlining the project's aims, results and conclusions.

Year two - quarter three

At the end of this quarter, students should have:

- submitted the final thesis in polished form for examination
- published the detailed conference paper on their project web page
- identified a journal, with a view to publishing an enhanced version of the paper
- polished the demonstration system if necessary
- if appropriate, prepared an online demonstration of their work into their project web page.

Year two - quarter four

At the end of this quarter, students should have:

- completed any updates or corrections required by the examiners, and submitted a final corrected thesis
- presented a final demonstration and verbal report to industrial partners/funders
- submitted a paper to a journal for refereeing, taking into account the feedback of the external examiners.

DOCTOR OF PHILOSOPHY DEGREES - PHD

As for the pure research MSc degree, the PhD degree involves the preparation of a thesis based on original and independent research. The residence period for full time pursuit of a PhD degree is normally 3 years.

A PhD candidate is expected to publish substantially more than an MSc candidate.

Research

CENTRE OF EXCELLENCE

Since 1997, the Department of Computer Science has hosted a Telkom Centre of Excellence, which focuses on distributed multimedia. The Centre brings together the research expertise within the department, contributions from other departments at Rhodes University and at other tertiary institutions (both nationally and internationally), and input from industry partners. The Centre is a good example of triple helix at work, where academia, industry and government come together to pool resources and improve the competitiveness of the industry, via the preparation of highly skilled practitioners and the co-development of appropriate technology. The Centre is supported by Telkom - the anchor partner, Coriant, and the National Research Foundation (NRF).

The Centre operates under the management of a joint academic/industry steering committee, and has high level representation from the partner industries and from the DTI through the National Research Foundation. The Centre is headed by Prof Alfredo Terzoli. Ms Ingrid Siebörger is the co-ordinator of the Centre and provides invaluable help.

RESEARCH GROUPS

The Department has a number of research and development groups, several of which feed into the realisation of the distributed multimedia platform under the auspices of the Centre of Excellence. They are:

- Convergence (Prof Alfredo Terzoli & Dr Mos Tsietsi)
- Security and Networks (Prof Barry Irwin & Mr Alan Herbert)
- Distributed Audio (Prof Richard Foss)
- Distributed and Parallel Computing (Prof Karen Bradshaw & Prof George Wells)
- ICT4D (Prof Alfredo Terzoli)
- Bioinformatics (Prof Philip Machanick)

They are described in some detail in the next few sections.

Convergence

This group carries the core activity of the Centre of Excellence, working at the provision of specific support for mobile devices in the previously developed distributed media-service platform. This is done through the investigation of available architectures to specialize appropriately, and the creation of suitable toolkits for the fast creation and deployment of services on the platform. Naturally, particular attention is given to services that integrate audio, video and location information.

Security and Networks (SNRG)

The Security and Networks Research Group (SNRG) efforts are concentrated in the areas of Information Security and Computer Networks. Members of the group are currently involved in a variety of projects, including a selection of visualisation techniques for security metrics, network traffic classification and monitoring, intrusion detection and hardware acceleration of these and other network and security centric tasks using commodity graphics cards.

Distributed Audio

Over the past 5 years, the Distributed Audio group has been involved in the conceptualization and implementation of a connection management and control protocol known as XFN (Cross Fire Network). This protocol is aimed at allowing for comprehensive control over the routing of audio within large sound installations such as stadiums, studios, convention centres, law courts, and live concerts. The project has involved embedded firmware programming of nodes for amplifiers and other professional audio devices, the construction and programming of special purpose routers, and the creation of graphical control software.

Distributed and Parallel Computing

This group has a long history in the department, going back to the origins of the paradigm in the 1980's when transputers were the main focus. More recently, the group's research efforts have focused on various aspects of Linda, a coordination language for parallel/distributed programming, grid computing and general purpose GPU programming. Emphasis is also placed on making concurrent programming more readily accessible to non-computer scientists.

ICT4D

Recently, the Centre has started a large, long-term multidisciplinary effort focused on the introduction of ICT in a deep rural area in the Mbashe area, on the Wild Coast in Transkei, in collaboration with the University of Fort Hare. There, technological solutions developed by both Universities are tested in the field, in rather harsh conditions. This research effort, connected closely to the other research pursuits in the department, situates itself in the growing area of ICT for Development. The field work is being structured as a living lab (Siyakhula Living Lab), a vehicle which permits the use of a new research methodology, whereby the services needed by a community are co-created with the community.

Bioinformatics

Prof Philip Machanick researches in bioinformatics and works with academics at Rhodes and other universities on identifying biologically interesting research problems. In this field it is possible at PhD level to obtain a degree in either the field of Computer Science or Bioinformatics.

CENTRE OF EXCELLENCE SPONSORS
